React JS Training

(Intermediate to Advanced)

Narasimha

Schedule for React JS Training

Day#	Date	Topic
Day-1	23-Nov-2023	State Management : Class Components
Day-2	24-Nov-2023	State Management : Functional Components, Hooks
Day-3	27-Nov-2023	Http Client Programming – AJAX Calls to APIs (Node JS)
Day-4	28-Nov-2023	Working with Forms, Validations, Services
Day-5	29-Nov-2023	Redux – State Management Library
Day-6	30-Nov-2023	Unit Testing React Application
Day-7	01-Dec-2023	Routing – SPA in React JS

Duration: 7 days (2hours per day); 9:30 am to 11:30 pm; 23^{th} Nov -1^{st} Dec

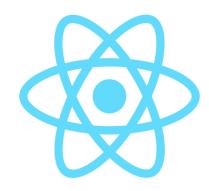

Day4 Working with Forms

Narasimha

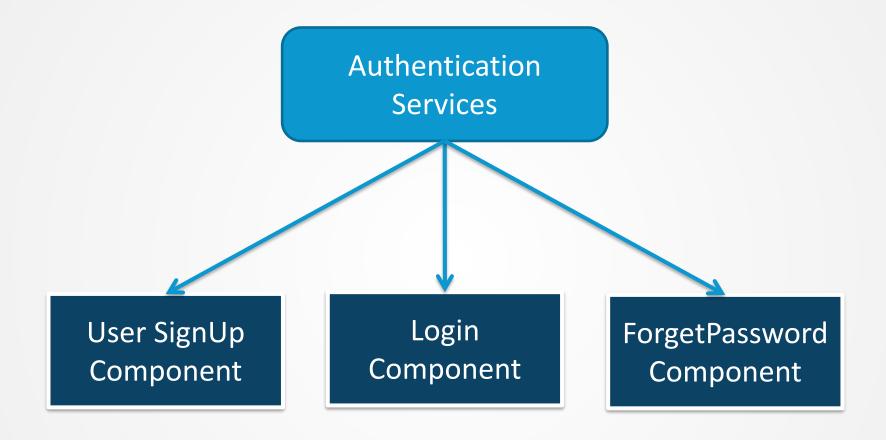

Index – Day4

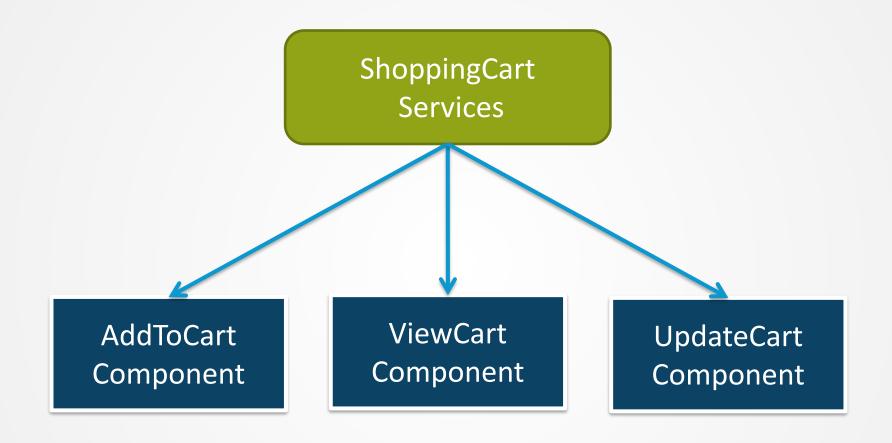

- 1. Recap: Reusable Services objects in React
- 2. Controlled and Uncontrolled components
- 3. React Forms
- 4. Custom Validations using React Forms

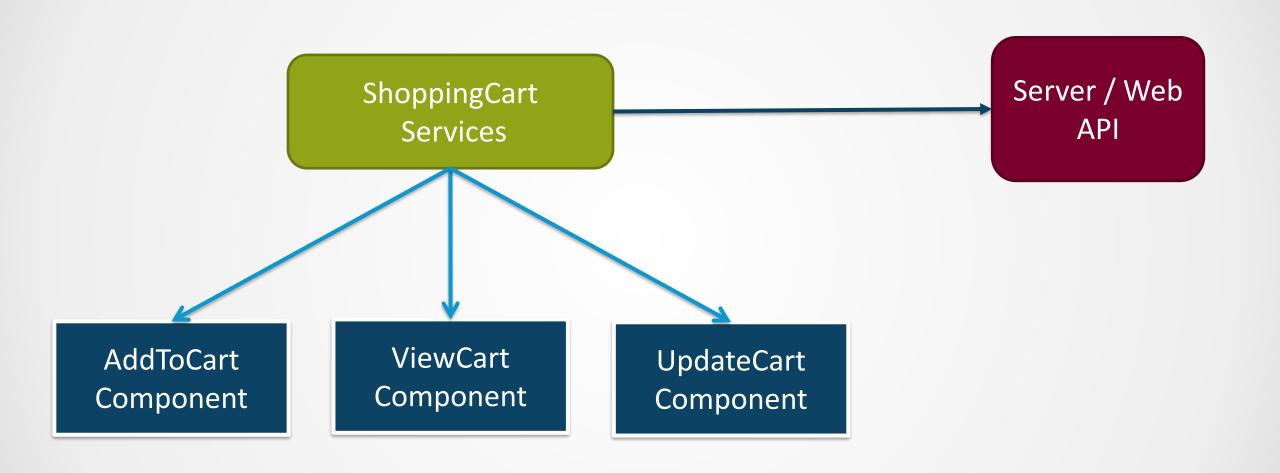

Reusable Services objects in React

- Service is just a group of helper functions that handle some operations particularly and can be reused across application.
- Eg:
 - Data Service that includes getData, updateData, deleteData, createData.....
 - Authentication Service that includes signing in, signing out, getting user info ...

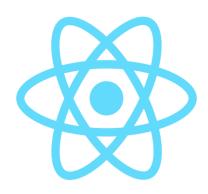

```
let dataSericeObj = {};
                               DataService.js
dataSericeObj.getAllDepts = function()
  // code to perform the operation
....
export default dataSericeObj;
```

```
App.js
import dataSericeObj from "./DataService";
function App() {
         dataSericeObj .getAllDepts();
export default App;
```

Practice Hands-On: CRUD on JSON-Server

Narasimha

- A Controlled Component is one that takes its current value through props and notifies changes through callbacks like on Change.
- A parent component "controls" it by handling the callback and managing its own state and passing the new values as props to the controlled component.

 A Uncontrolled Component is one that stores its own state internally, and you query the DOM using a ref to find its current value when you need it. This is a bit more like traditional HTML.

- In most cases, we recommend using controlled components to implement forms.
- In a controlled component, form data is handled by a React component.
- The alternative is uncontrolled components, where form data is handled by the DOM itself.
- To write an uncontrolled component, instead of writing an event handler for every state update, you can use a ref to get form values from the DOM.

```
import {useRef} from 'react';

const inputRef = useRef(null);

<input ref={inputRef} type="text" value={uname} />
inputRef.current.focus();
```

React Forms

Sr. IT Trainer/Consultant

Working with Forms in React

- Just like in HTML, React uses forms to allow users to interact with the web page.
- You can add a form with React like any other html element
- This will work as normal, the form will submit and the page will refresh. But this is generally not what we want to happen in React.
- We want to prevent this default behavior and let React control the form.

onSubmit event

/form>

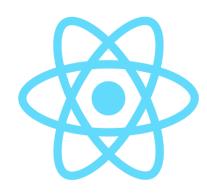

```
const handleSubmit = (event) =>
    event.preventDefault();
    alert(`Form is submitted by user`);
<form onSubmit={handleSubmit}>
    <input type="submit" />
```

Code Snippets

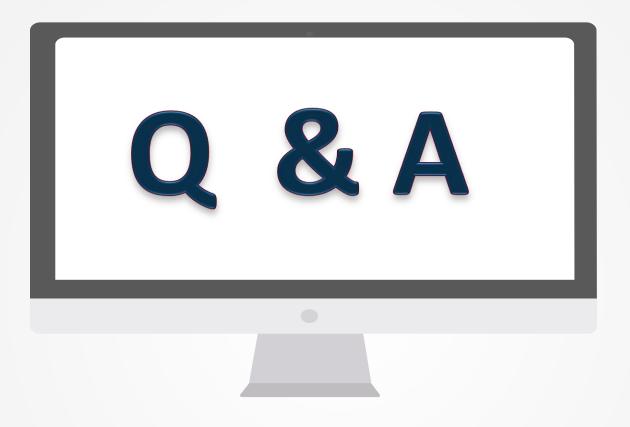

```
let tempErrorObj = Object.assign({}, errorsObj);
let valuesArray = Object.values(tempErrorObj);
let index = valuesArray.findIndex( item => item.length != 0 );
```

Practice Hands-Ons
